

One line per assay: colour = family, marker and linestyle fixed per assay across F1-F7, so the figure survives greyscale printing. The C2 verdict is read off T against N2, the tabulated quantity plotted is named on the axis. T against N1 and T against N2 are NOT interchangeable -- N1 destroys the additive structure, N2 preserves it -- so the two are never drawn on one axis.

The hatched band is the frozen C2 refutation region ($\max T < 1.5$ with CI upper < 2.0): a DECISION region, the only shading in F1-F7 that is not a real null envelope.

The whole sweep grid $\tau = 2, 3, 4, 5, 6, 8$ is drawn on the x axis even where the tables carry no point, so what is missing is visible.
