

Panel (a) plots the POOLED rate $\sum_{cliff} / \sum_{pairs}$ over the permissible assays in each (Levy class, decile) cell, with ± 1 binomial SE from those same tabulated counts -- the only arithmetic in this figure beyond a ratio and a mean. NS1 bands are NOT drawn: T09 carries p_{NS1} and the burial-matched OR with its CI, but no NS1 quantiles for the rate itself, and a band that is not a real null envelope is forbidden (spec Sec.6). Panel (b): the assay AUROC is the mean over every pairs of T10's per-pair AUROC contribution (the Mann-Whitney identity), annotated with $n(cliff)/n(non-cliff)$ and the NS2 permutation p ; p is at the B=10,000 floor for every assay. No bootstrap band is tabulated, so none is drawn. Panel (c): black dots mark $iface_flag$ per partner. Panel (d): the NS3 draws are not tabulated (only mean and SD), so the histogram spec Sec.6 asks for is replaced by the null mean ± 1 SD. T11 on the designed negative, verbatim: "VEGF is the DESIGNED C4 negative control (0/9 positions at the VEGF interface, dSASA exactly 0)".
